

Probability of ripple

The heatmap displays the probability of a ripple effect across a 20x20 grid. The color scale ranges from dark blue (low probability) to yellow (high probability). The highest probability area is in the top right corner, with a yellow cell at (1, 18) and a light green cell at (1, 19). Other high probability areas are scattered in the top right and bottom right, including orange and red cells.
